DADOS QUE PRESERVAM AS DIFERENÇAS

Faixas variáveis continuam variáveis. Os sinais +, < e > foram preservados, assim como as exceções de cor das cervejas com frutas.

COMO LER CADA FICHA

ABV: álcool por volume (%), não por peso. IBU: medida analítica de amargor. SRM: escala de cor. A cor de fundo identifica o grupo de estilos, não a aparência do líquido.

BR, IR, AM, GE, BF e OA identificam os seis grupos de ales; LE, LN e LO, os três grupos de lagers. HM identifica as híbridas/mistas. Números e siglas são editoriais, não códigos oficiais de competição.

p. indica a página impressa do guia. Os nomes foram compactados para leitura: "-Style" foi omitido, "India Pale Ale" virou IPA e "India Pale Lager", IPL. Os nomes completos estão no índice de dados.

EXCEÇÕES QUE IMPORTAM

var.: a fonte não fixa uma faixa numérica única. +: o valor pode ultrapassar a referência indicada. < e >: limites abertos, preservados conforme o guia.

* BF18: a cor acompanha a fruta. HM07: 5-50 SRM ou cor da fruta. HM08: 2-10 SRM ou cor da fruta. Nessas cervejas, a descrição visual é indispensável.

Nas cervejas Juicy/Hazy, a fonte ressalta que IBU e amargor percebido podem diferir significativamente. HM35 tem ABV <0,5% nesta referência; isso não equivale a 0,0%.
